New Confirmed Cases

In which communities is SARS-CoV-2 spreading?

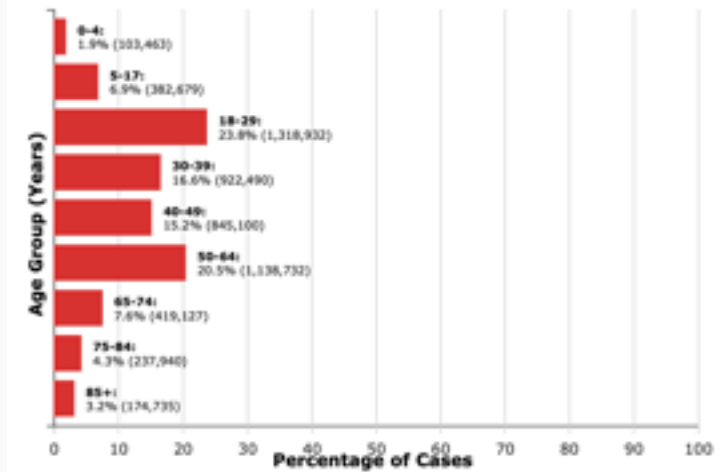

In which communities is SARS-CoV-2 spreading?

In which communities is SARS-CoV-2 spreading?

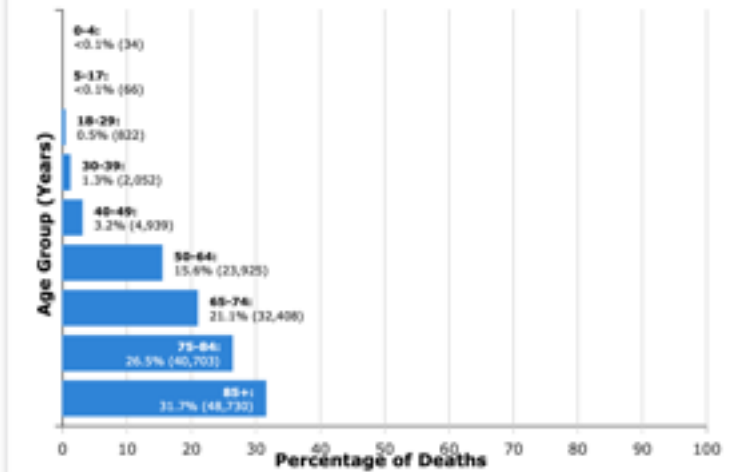

Cases by Age Group:

Data from 5,735,507 cases. Age group was available for 5,543,198 (96%) cases.

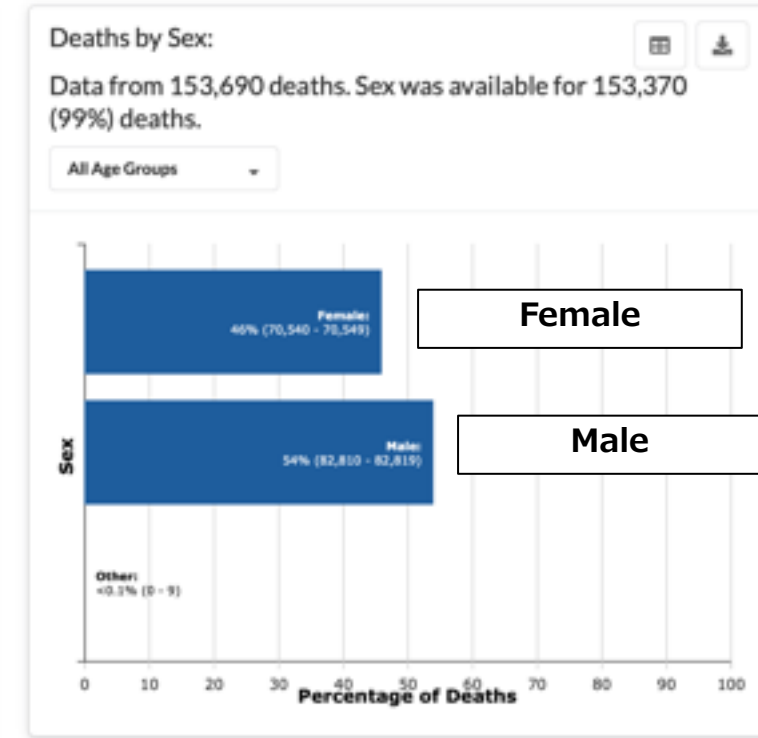

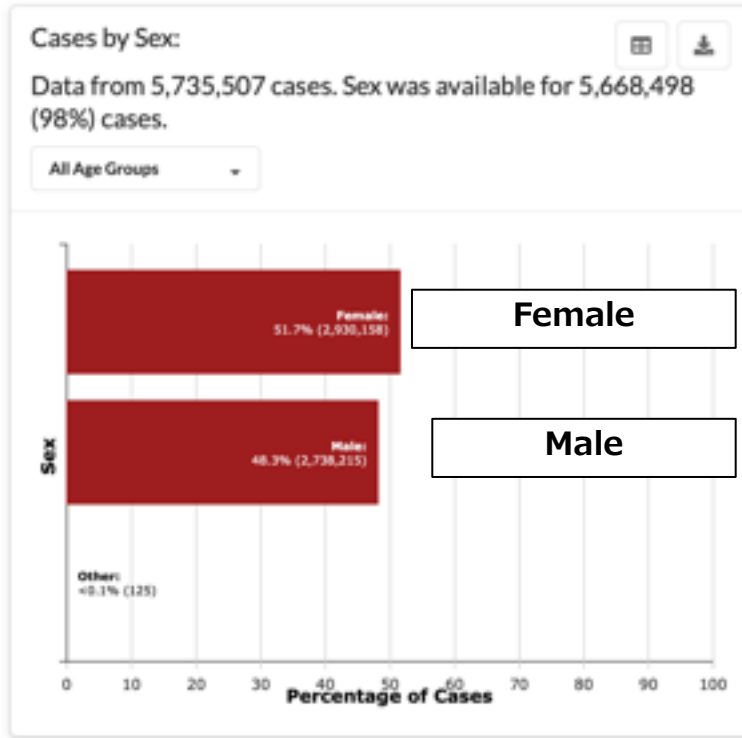

Deaths by Age Group:

Data from 153,690 deaths. Age group was available for 153,679 (99%) deaths.

In which communities is SARS-CoV-2 spreading?

Is SARS-CoV-2 airborne?

CDC

“The epidemiology of SARS-CoV-2 indicates that most infections are spread through close contact, not airborne transmission…”

Airborne transmission of SARS-CoV-2 can occur under special circumstances…

Enclosed spaces

Prolonged exposure to respiratory particles

Inadequate ventilation or air handling

SARS-CoV-2 is a new virus, and we are still learning about how it behaves.”

Antibody testing

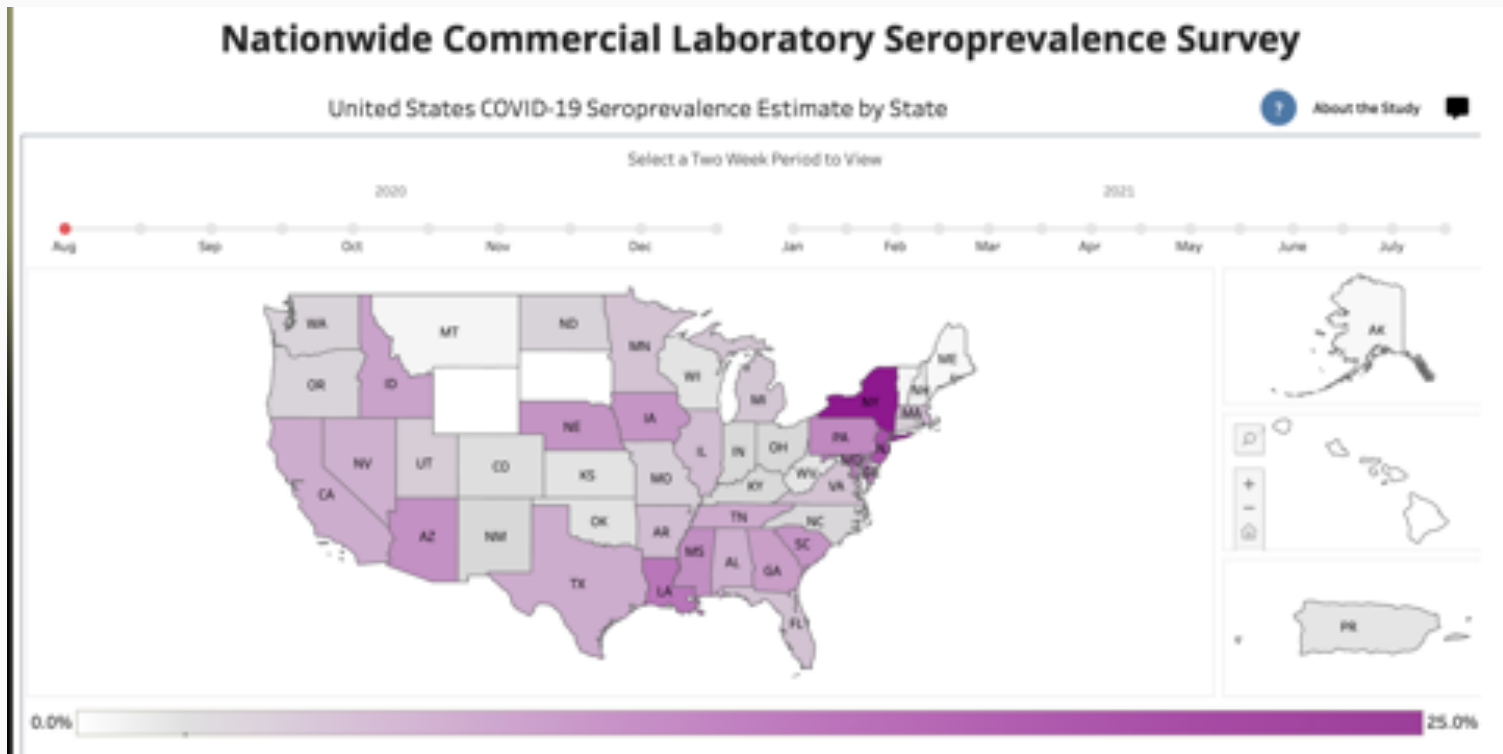

Are all anti-SARS-CoV-2 antibody tests equivalent?

Anti-SARS-CoV-2 antibody dynamics

National anti-SARS-CoV-2 seroprevalence

CDC guidelines for antibody testing

- Several serologic assays for SARS-CoV-2 have Emergency Use Authorization (EUA) by the U.S. Food and Drug Administration (FDA), which has independently reviewed their performance.
- Currently, there is no identified advantage whether the assays test for IgG, IgM and IgG, or total antibody.
- It is important to minimize false-positive test results by choosing an assay with high specificity and by testing populations and individuals with an elevated likelihood of previous exposure to SARS-CoV-2. Alternatively, an orthogonal testing algorithm (i.e., employing two independent tests in sequence when the first test yields a positive result) can be used when the expected positive predictive value of a single test is low.
- Antibodies most commonly become detectable 1–3 weeks after symptom onset, at which time evidence suggests that infectiousness likely is greatly decreased and that some degree of immunity from future infection has developed. However, additional data are needed before modifying public health recommendations based on serologic test results, including decisions on discontinuing physical distancing and using personal protective equipment.

Antivirals

Remdesivir

QUESTION Does remdesivir provide a benefit on clinical status for patients hospitalized with moderate COVID-19 pneumonia?

CONCLUSION This clinical trial found that hospitalized patients with moderate COVID-19 randomized to a 5-day course, but not a 10-day course, of remdesivir had a statistically significant better clinical status vs standard care at 11 days, but the difference was of uncertain clinical importance.

POPULATION	INTERVENTION	FINDINGS

IL-6 inhibitors

NIH COVID-19 Treatment Guidelines

Last Updated: August 27, 2020

Interleukin (IL)-6 is a pleiotropic, pro-inflammatory cytokine produced by a variety of cell types, including lymphocytes, monocytes, and fibroblasts. Infection by the severe acute respiratory syndrome-associated coronavirus (SARS-CoV) induces a dose-dependent production of IL-6 from bronchial epithelial cells.¹ COVID-19-associated systemic inflammation and hypoxic respiratory failure can be associated with heightened cytokine release, as indicated by elevated blood levels of IL-6, C-reactive protein (CRP), D-dimer, and ferritin.²⁻⁴ It is hypothesized that modulating the levels of IL-6 or its effects may alter the course of disease.

There are two classes of Food and Drug Administration (FDA)-approved IL-6 inhibitors: anti-IL-6 receptor monoclonal antibodies (e.g., sarilumab, tocilizumab) and anti-IL-6 monoclonal antibodies (siltuximab). These classes of drugs have been evaluated for the management of patients with COVID-19 who have systemic inflammation. The COVID-19 Treatment Guidelines Panel's (the Panel's) recommendations and clinical data to date are described below.

Recommendation

The Panel **recommends against** the use of anti-IL-6 receptor monoclonal antibodies (e.g., **sarilumab**, **tocilizumab**) or anti-IL-6 monoclonal antibody (**siltuximab**) for the treatment of COVID-19, except in a clinical trial (**BI**).

Is SARS-CoV-2 exposure protective?

CLOSING

- **Transmission trends**

- *no signs that transmission is slowing down on its own*
- *no evidence of an 'herd immunity' effect*
- *how important is airborne transmission?*

- **Diagnostics**

- *RNA testing is the gold standard*
- *Antibody testing has variable accuracy*
- *Antigen testing requires improvements*
- *Testing needs to keep pace with the pandemic*
- *Home testing?*

- **Therapeutics**

- *Some progress with antivirals and immunomodulatory agents*
- *No magic bullet (yet)*
- *Repurposed drugs have been disappointing*
- *Adaptive platforms and trials infrastructure has been encouraging*

- **Vaccines**

- *Several show promising antibody and T cell responses*
- *Concerns about the speed of development (safety?)*
- *Re-infection data is sobering, but not sufficient to prove that vaccines will not work*

CLOSING

- **Transmission trends**

- *no signs that transmission is slowing down on its own*

- *how important is airborne transmission?*

- **Diagnostics**

- *RNA testing is the gold standard*
- *Antibody testing has variable accuracy*
- *Antigen testing requires improvements*
- *Testing needs to keep pace with the pandemic*
- *Home testing?*

- **Therapeutics**

- *Some progress with antivirals and immunomodulatory agents*
- *No magic bullet (yet)*
- *Repurposed drugs have been disappointing*
- *Adaptive platforms and trials infrastructure has been encouraging*

- **Vaccines**

- *Several show promising antibody and T cell responses*
- *Concerns about the speed of development (safety?)*
- *Re-infection data is sobering, but not sufficient to prove that vaccines will not work*

CLOSING

- **Transmission trends**

- *no signs that transmission is slowing down on its own*
- *no evidence of an 'herd immunity' effect*
- *how important is airborne transmission?*
